OPEN RANGE BREAKOUT (ORB) is an important strategy to trade breakouts on various trading instruments.

I want you to search far and wide and come up with the best and latest ORB technical implementation. i want as far as possible not to use indicators, but more SMC and ICT principles.

The most current and technically robust Open Range Breakout (ORB) strategy, integrating SMC and ICT principles rather than relying on traditional indicators, involves blending Fair Value Gaps, order block logic, market structure shifts, and liquidity concepts for systematic, high-probability trades.[1] [2] [3]

SMC/ICT-Based ORB Implementation

- **Opening Range Definition:** Mark the high and low of the initial session window (first hour of the London or New York session is popular for FX and metals).[4] [5] [3]
- **Breakout Confirmation:** Execute trades only when price breaks out of the defined opening range and a retest or strong rejection occurs on that zone (avoid impulsive entries).[2] [3]
- **Fair Value Gap Pullback:** After the breakout, wait for the price to pull back into a Fair Value Gap (FVG)—a zone between a strong candle and weaker candles; this is where institutions often add liquidity.[3] [1]
- **Structure Shift Entry:** Confirm entry only when there is a clear Break of Structure (BOS) or Change of Character (CHoCH) in the FVG zone, indicating institutional involvement and trend alignment.[1] [3]
- **Order Block Support:** Where possible, align entries with order blocks—areas where large volume transactions occurred—which act as magnets for price.[3] [1]
- **Liquidity Concepts:** Prioritize breakout moves toward obvious liquidity pools, such as above prior highs or lows, as these are typical institutional targets and boost the probability of momentum following the breakout.[1] [3]
- **Trade Management:** Use stop-loss placement just below the recent swing low/high, depending on direction, and take profit at a minimum 1:2 or 1:3 risk-reward ratio, or near the next significant liquidity pool.[2] [3]

Practical Workflow (No Indicators)

- Mark high/low of opening session.
- Wait for price to break and retest the range boundary.
- Look for price to enter an FVG after retest (do not chase the initial move).
- Watch for BOS/CHoCH in the FVG.
- Enter on a strong engulfing candle in the FVG area.
- Place stop below/above recent swing.
- Target at least the next liquidity pool or a solid risk/reward multiple.
- Avoid trading during major news or highly illiquid markets.

Key Features and Rationale

- Prioritizes institutional price action cues instead of retail indicators.[2] [3] [1]
- Combines multiple SMC/ICT concepts for layered confirmation.[3] [1] [2]
- Adaptable for algorithmic implementation and automation.
- Works best in highly liquid instruments with clear session volatility (FX majors, gold, index futures).
- Backtesting on multiple timeframes (15, 30, 60 min window) indicates optimal results usually occur with longer opening ranges (e.g., 60 minutes) for fewer but higher-quality setups.[4]
- Risk management and discipline are fundamental—patience until all criteria are met is essential for longevity.[6] [2] [3]

This approach discards conventional indicators in favor of direct price-action-based logic rooted in institutional trade footprints, offering both discretionary and algorithmic traders a robust edge in current markets.[1] [2] [3]
