i want detail of "Veltrix FVG ORB SMC Strategy"

Based on your attached file and comprehensive research, here's the **complete breakdown of the Veltrix FVG ORB SMC Strategy**—a sophisticated approach designed for **XAU/USD (Gold)** trading that combines institutional concepts with precision entry techniques.[1] [2] [3]

Strategy Foundation

The Veltrix strategy is a **multi-concept confluence system** that layers Opening Range Breakout mechanics with Smart Money institutional footprints, specifically designed for **M30 chart entries** with **H4 confirmation**.[2] [1]

Core Components

Opening Range Breakout (ORB)

- Mark the **high and low of the first 30-60 minutes** of either the **London session (2:00-3:00 AM EST)** or **New York session (8:30-9:30 AM EST)**.[3] [1] [2]
- This range acts as your **liquidity boundary** and initial framework for the day.[1] [2]
- The strategy avoids impulsive entries on the first breakout; instead, it waits for **institutional validation**.[2] [1]

Fair Value Gap (FVG) Detection

- An **FVG** is a price imbalance—a gap between candles created when price moves aggressively in one direction, leaving inefficiencies.[3] [1] [2]
- **Bullish FVG:** The low of candle 1 is higher than the high of candle 3 (gap in between).[4] [1] [3]
- **Bearish FVG:** The high of candle 1 is lower than the low of candle 3.[4] [1] [3]
- Institutions often return to these zones to fill orders before continuing the primary trend.[1] [2] [3]

Smart Money Confirmation (BOS/CHoCH)

- **Break of Structure (BOS):** Price breaks a recent swing high/low, confirming trend continuation.[5] [2] [1]
- **Change of Character (CHoCH):** A reversal signal where price fails to make a new high/low and breaks structure in the opposite direction.[5] [2] [1]
- These confirm that institutional order flow has shifted direction.[2] [5] [1]

Liquidity Sweep Integration

- Before the true move, price often **sweeps liquidity** (stop hunts) above the OR high or below the OR low to trigger retail stop-losses.[3] [1] [2]
- This sweep creates the displacement candle that forms the FVG.[1] [2] [3]

Step-by-Step Trade Execution

Step 1: Pre-Market Preparation (H4 Bias)

- On the **H4 timeframe**, identify the current market trend direction.[5] [3] [1]
- Mark **major swing highs/lows** and identify **liquidity pools** (previous day high/low, equal highs/lows).[6] [5] [1]
- Draw **higher timeframe order blocks** (last candle before strong impulsive move).[6] [5] [1]
- Your trades must **align with this higher timeframe bias**.[5] [3] [1]

Step 2: Mark Opening Range (M30)

- Switch to **M30 chart** at session open.[2] [3] [1]
- Mark the **first 30-60 minute high and low**.[3] [1] [2]
- Draw horizontal lines or box to visualize the range.[1] [2] [3]

Step 3: Wait for Liquidity Sweep

- **Do not enter on the first breakout**—this is usually a trap.[2] [3] [1]
- Wait for price to **spike above OR high** (for bearish setup) or **below OR low** (for bullish setup).[3] [1] [2]
- This sweep triggers retail stops and creates the displacement candle.[1] [2] [3]

Step 4: Identify the Fair Value Gap

- After the liquidity sweep, look for the **FVG created by the displacement move**.[2] [3] [1]
- Mark the gap zone between the wicks of the first and third candles.[3] [1] [2]
- This becomes your **sniper entry zone**.[1] [2] [3]

Step 5: Confirm Structure Shift (BOS/CHoCH)

- **For bullish setup:** Price sweeps below OR low → creates bullish FVG → then shows BOS/CHoCH upward.[5] [2] [1]
- **For bearish setup:** Price sweeps above OR high → creates bearish FVG → then shows BOS/CHoCH downward.[5] [2] [1]
- Wait for a **strong engulfing candle** or **rejection wick** within the FVG.[2] [3] [1]

Step 6: Execute Entry

- Enter when price **returns to the FVG zone** and shows rejection.[3] [1] [2]
- Optional: Refine entry on **M5 or M1** for precision, but keep H4/M30 context.[1] [3]
- Entry types: market order on confirmation candle close, or limit order in FVG zone.[2] [3] [1]

Step 7: Set Stop-Loss & Take-Profit

- **Stop-Loss:** Place just **beyond the sweep candle low/high** or below/above the FVG zone (typically 20-30 pips for Gold).[3] [1] [2]
- **Take-Profit 1 (TP1):** Target the **opposite side of the Opening Range** (minimum 1:2 R:R).[1] [2] [3]
- **Take-Profit 2 (TP2):** Target the **next major liquidity pool** (previous day high/low, H4 order block) for 1:3+ R:R.[2] [3] [1]
- Consider **partial profit taking** at TP1 and trailing stop to breakeven.[3] [1] [2]

Session Timing Optimization

The Veltrix strategy emphasizes specific **kill zones** for highest probability setups:[3]

London Open (2:00 AM - 5:00 AM EST)

- Best for **liquidity sweep identification**.[3]
- Look for FVG formation around 5:00-8:00 AM after initial volatility.[3]

New York Open (8:30 AM - 11:00 AM EST)

- Prime time for **CHoCH/BOS confirmation**.[3]
- Look for setups around 2:30-4:30 PM for continuation moves.[3]

Avoid: Low-liquidity Asian session and major news events unless experienced.[3]

Risk Management Rules

- Maximum **1-2% risk per trade**.[1] [2] [3]
- Never trade without all three confluences: **ORB breakout + FVG + BOS/CHoCH**.[2] [1]
- If entry is not triggered within **3-4 candles** after FVG forms, setup is invalid.[4] [1]
- Avoid trading during **low-liquidity periods** or immediately after high-impact news.[1] [2]
- Use a **compounding plan**: Start with fixed profit targets ($15, $30, $60, etc.) and scale lot size accordingly.[3]

Trade Examples

Bullish Setup (Long)

1. Mark NY opening range 8:30-9:30 AM: High = 2650, Low = 2645.[2] [1]
2. Price sweeps below 2645 to 2643 (liquidity sweep).[1] [2]
3. Bullish FVG forms between 2644-2646.[2] [1]
4. Price shows BOS breaking above recent structure at 2648.[1] [2]
5. Entry: 2646 (in FVG zone on M30/M15).[2] [1]
6. Stop-Loss: 2643 (below sweep low).[1] [2]
7. TP1: 2652 (OR high + buffer) = 1:2 R:R.[2] [1]
8. TP2: 2658 (H4 liquidity pool) = 1:4 R:R.[1] [2]

Bearish Setup (Short)

1. Same logic inverted: sweep above OR high → bearish FVG → CHoCH downward → short on retest.[2] [1]

Advanced Refinements

Multi-Timeframe Sync

- H4 for bias and major structure.[6] [5] [1]
- M30 for ORB and primary FVG identification.[1] [2] [3]
- M5/M1 for precision entries and micro-FVG confirmation.[1] [3]

Order Block Enhancement

- Combine FVG with **order blocks** at the range extremes for added confluence.[5] [1]
- The last bullish/bearish candle before the sweep often acts as an institutional order block.[5] [1]

Volume Validation

- Though indicator-free, you can optionally observe **displacement candle size**—larger bodies indicate stronger institutional involvement.[2] [1]

Common Mistakes to Avoid

- **Entering the first breakout** without waiting for liquidity sweep and FVG retest.[2] [3] [1]
- **Ignoring higher timeframe bias**—never trade against H4 structure.[5] [3] [1]
- **Chasing price**—let price come to your FVG zone; don't chase the move.[3] [1]
- **Overtrading**—only trade when all three elements align perfectly.[1] [2] [3]

- **Poor risk management**—always maintain fixed % risk regardless of confidence level.[2] [3] [1]

Algorithmic Implementation Notes

For MQL5/PineScript automation of this strategy:[7] [2]

- Code session time detection for automatic OR marking.
- Program FVG scanner using 3-candle gap logic.
- Build BOS/CHoCH detection using swing high/low comparison arrays.
- Implement liquidity sweep detection (price temporarily breaching OR by X pips then reversing).
- Add risk calculator for dynamic lot sizing based on SL distance.

This Veltrix methodology represents a **2025-optimized institutional approach** specifically refined for Gold trading, combining mechanical ORB logic with discretionary SMC validation for consistently high probability entries.[3] [1] [2]
