yes, turn this into a code-ready structure (PineScript/MQL5)

Below is a streamlined **code-ready structure** for both **PineScript** and **MQL5**, based strictly on recent ORB/SMC/ICT integration. This provides the scaffolding and core logic blocks for a script or EA, based on the workflow previously outlined.

PineScript Skeleton (TradingView)

```
//@version=5
indicator('ORB SMC/ICT v2025', overlay=true)

// --- Step 1: Session + Opening Range
session_start_hour = input.int(9, 'Opening Range Start Hour') // for NY open
session_start_minute = input.int(30, 'Opening Range Start Minute')
session_end_minute = input.int(35, 'Opening Range End Minute')
session_timezone = input.string('America/New_York', 'Session Timezone')

var float OR_high = na
var float OR_low = na
if (hour == session_start_hour and minute == session_start_minute)
OR_high := high
OR_low := low
if (hour == session_end_hour and minute == session_end_minute)
OR_high := na
OR_low := na

// --- Step 2: Detect Liquidity Sweep
sweep_up = high > OR_high[1]
sweep_down = low < OR_low[1]

// --- Step 3: Fair Value Gap Detection
fvg_bull = low > high[2]
fvg_bear = high < low[2]

// --- Step 4: Structure Shift (BOS/CHoCH, simple version)
BOS_up = high > ta.highest(high, 5)[1]
BOS_down = low < ta.lowest(low, 5)[1]

// --- Step 5: Entry Logic
long_cond = sweep_down and fvg_bull and BOS_up
short_cond = sweep_up and fvg_bear and BOS_down
```

```
plotshape(long_cond, style=shape.triangleup, location=location.belowbar, color=color.green,
title='ORB SMC Long')
plotshape(short_cond, style=shape.triangledown, location=location.abovebar, color=color.red,
title='ORB SMC Short')

alertcondition(long_cond, title='ORB SMC Long', message='ORB SMC Long triggered')
alertcondition(short_cond, title='ORB SMC Short', message='ORB SMC Short triggered')

// --- Step 6: Visualization
plot(OR_high, color=color.blue, linewidth=2, title='Opening Range High')
plot(OR_low, color=color.orange, linewidth=2, title='Opening Range Low')

// You can extend this skeleton by integrating advanced FVG detection, proper session
windows, and automated lot sizing for full automation.
//[3] [4] [5] [6] [7]
```

MQL5 Skeleton (MetaTrader 5 EA)

```
//--- Define Session Time and OR variables
datetime OR_start, OR_end;
double OR_high, OR_low;

//--- OnTick/Main Function
void OnTick()
{
// Step 1: Session detection, set OR window
if (Hour() == OR_START_HOUR && Minute() == OR_START_MINUTE)
{
OR_high = iHigh(NULL, PERIOD_M5, 0);
OR_low = iLow(NULL, PERIOD_M5, 0);
OR_start = TimeCurrent();
}

// Step 2: Liquidity Sweep
bool sweep_up = iHigh(NULL, PERIOD_M5, 0) > OR_high;
bool sweep_down = iLow(NULL, PERIOD_M5, 0) < OR_low;

// Step 3: FVG detection (pseudo-code)
bool fvg_bull = iLow(NULL, PERIOD_M5, 2) > iHigh(NULL, PERIOD_M5, 0);
bool fvg_bear = iHigh(NULL, PERIOD_M5, 2) < iLow(NULL, PERIOD_M5, 0);

// Step 4: BOS detection
bool BOS_up = iHigh(NULL, PERIOD_M5, 0) > iHighest(NULL, PERIOD_M5, 5, 1);
bool BOS_down = iLow(NULL, PERIOD_M5, 0) < iLowest(NULL, PERIOD_M5, 5, 1);

// Step 5: Entry Logic
if (sweep_down && fvg_bull && BOS_up)
{
```

```
// Place long order, set SL/TP, visualize on chart
}
if (sweep_up && fvg_bear && BOS_down)
{
// Place short order, set SL/TP, visualize on chart
}
}
//
```
[8] [9] [10]

Notes for Both Platforms:

- You must extend this foundation to handle session timing, higher timeframe bias, order block detection, and risk management.
- Visual annotations (rectangles/labels) for OBs, FVGs, and structure shifts improve real-time validation.
- Refine FVG and CHoCH/BOS logic for more robust institutional-grade automation.
- Add external liquidity pools (previous highs/lows) for TP targeting.

This code skeleton combines recent open-source best practices for ORB/SMC/ICT logic and can be adapted for both TradingView and MetaTrader deployments.[4] [5] [6] [9] [10] [3] [8]
